Electric Door Strikes

Electric door strike is a locking mechanism that is used on public access doors which are to remain locked. Access to this lock from a public area is usually achieved using a card / Pin or electronic means, but using a metal key on the mortised cylindrical lock is also possible.

These industrial grade door strikes can withstand extreme human traffic access control applications. They are tested to 100,000 cycles. These strikes can be fail-secure and fail-open for free exit applications. They can be used with cylindrical, narrow line and mortise locks with centerline latch entry.

The Model that we carry is from TLC (Toronto Lock Company) and the Model is LES-120. It's a 12VDC version c/w Aluminium Hairline Faceplate and all securing accessories shown above.

For lock installation please email to sales@securitex.com.sg
